
THE CHECKOUT TRIALS
Sentinel
Your checkout isn't broken.
It's just broken for someone you've never met.
Built for the PayPal AI Hackathon · Braintree sandbox · Gemini

THE PROBLEM

Shops are built on fast laptops by people with steady hands and good eyes.

Low vision

A shopper with low vision can't read pale text.

Slow signal

A shopper on one bar of signal gives up on a heavy page.

No mouse

A shopper without a mouse can't reach a fake button.

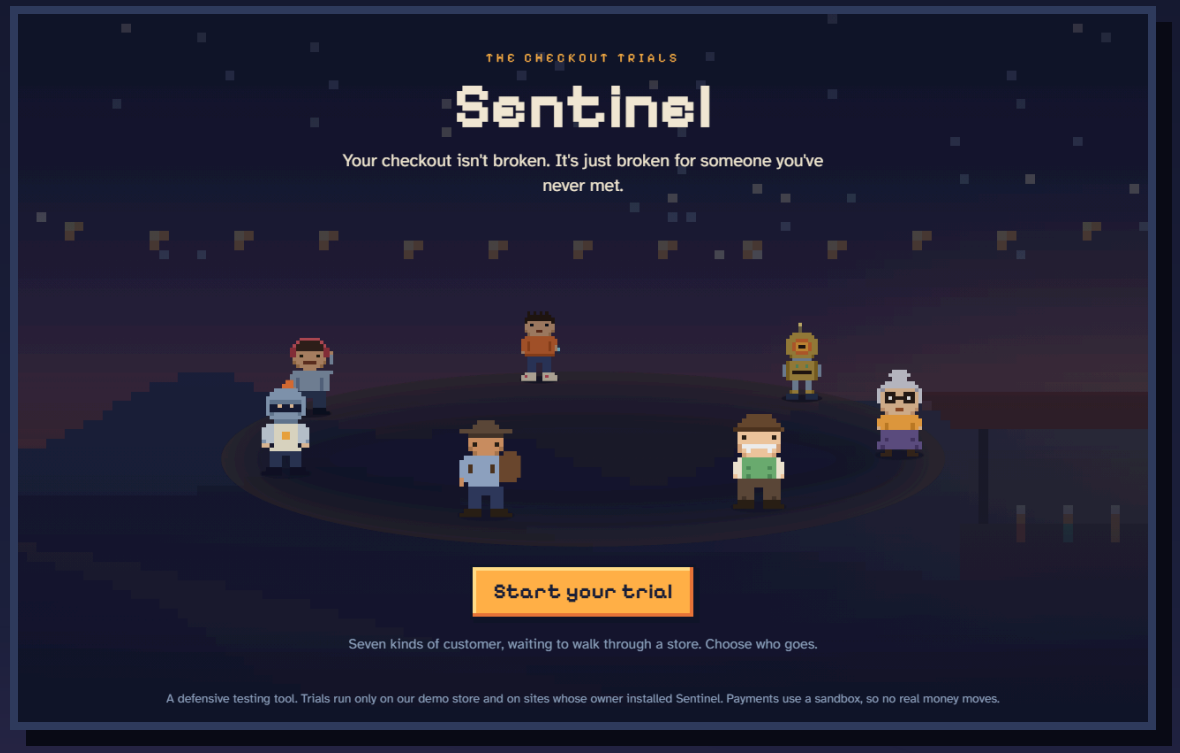

They leave quietly. The shop owner only ever sees a lower sales number, never why.

THE IDEA

Don't read a report. Watch them try to buy from you.

Sentinel sends seven pixel-art shoppers through a real checkout. Each one stands for a real kind of customer, checks the page the way that customer would, and reacts when something gets in the way.

Every problem costs coins from their purse. Lose too much patience, lose the sale.

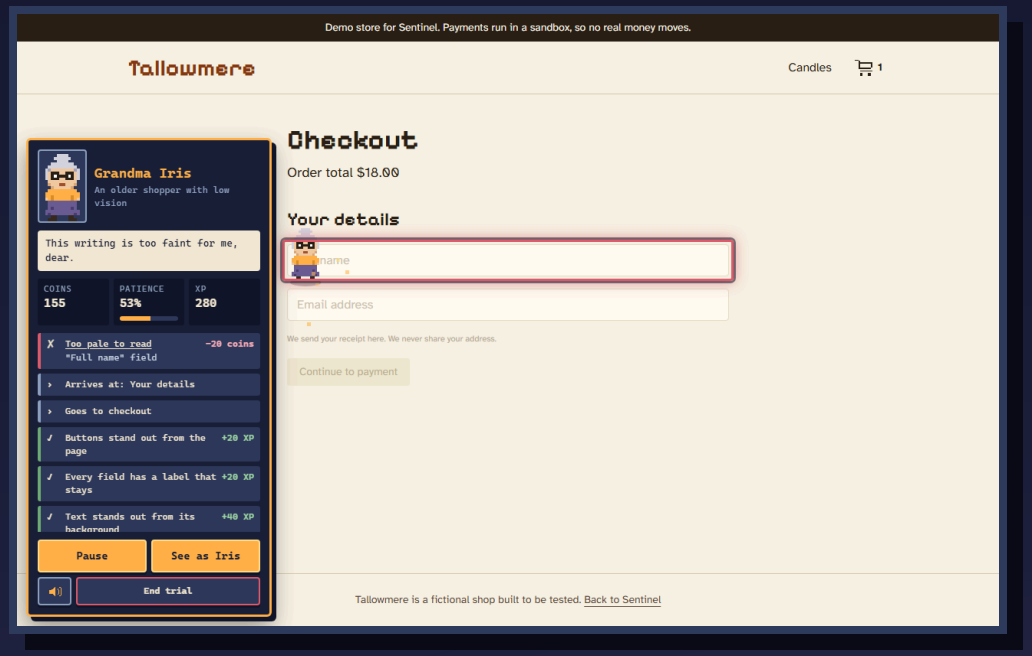

MEET THE SHOPPERS

Seven kinds of customer. 29 checks between them.

Pick who goes. Each one checks the page the way that customer would.

A TRIAL

They walk the real page.

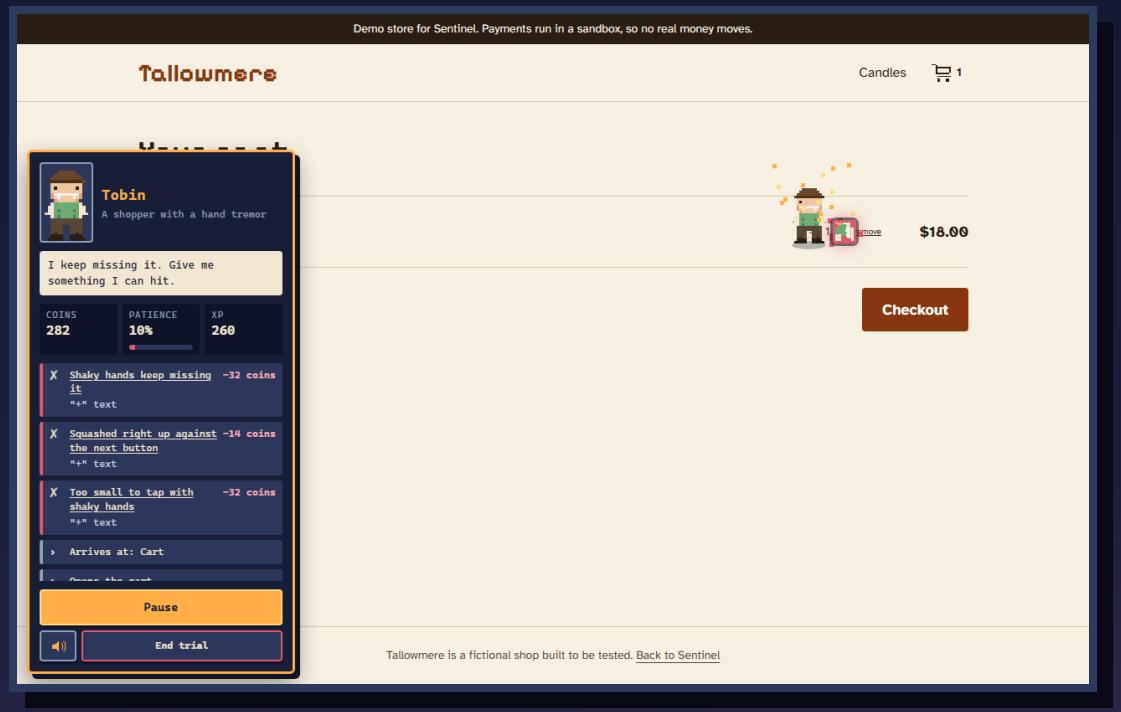

- Every number is measured by the browser on the live page.
- The shopper walks to each problem, reacts, and loses coins.
- The checkout is a real Braintree sandbox payment.

1.6:1

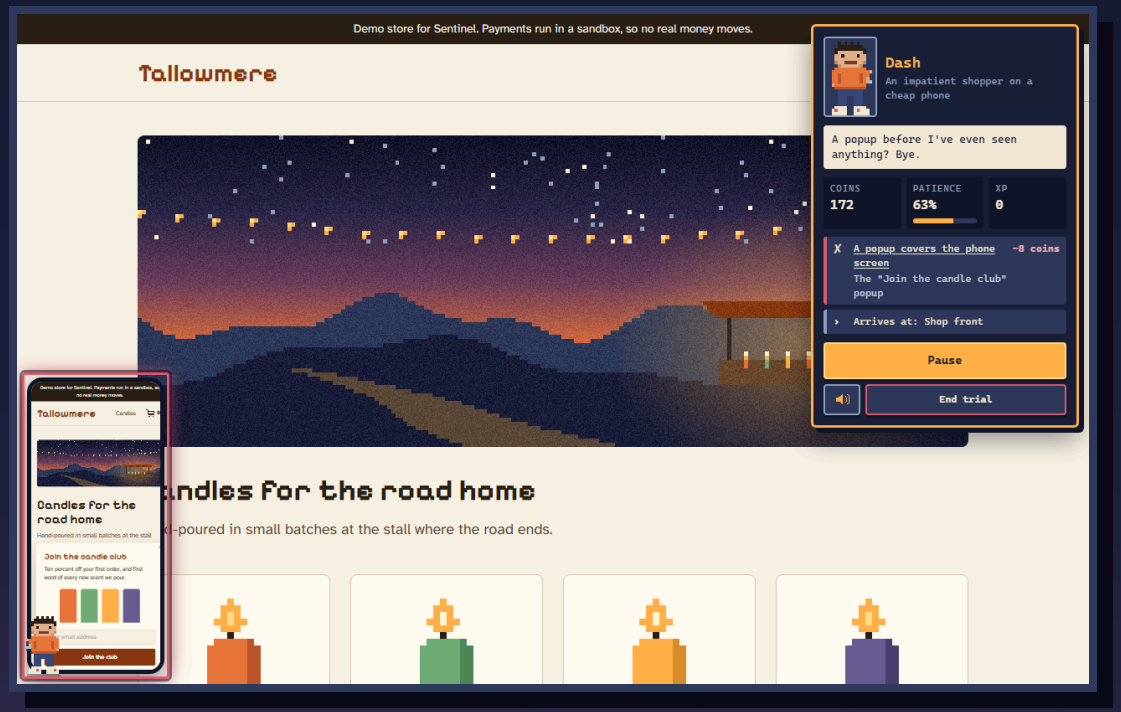

contrast on the checkout button, where 4.5:1 is needed

DIFFERENT SHOPPERS, DIFFERENT PROBLEMS

Each one fails your checkout in a different way.

Tobin: 20 simulated shaky taps at a tiny button. Red dots missed.

Dash: a popup covers the phone screen before a single candle shows.

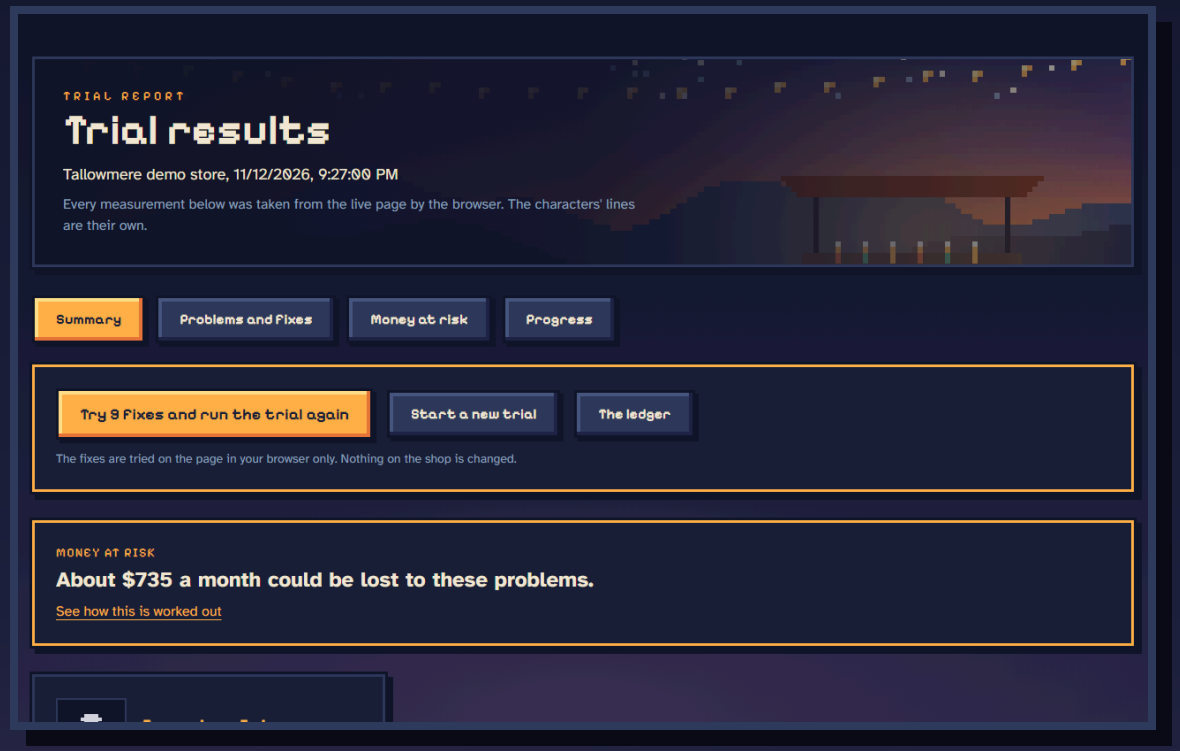

WHAT IT COSTS

Plain words first. Detail when you want it.

- Who bought, who left, and where.
- The worst problems, in plain words.
- An estimate of money at risk each month.
- An AI verdict from Gemini, written from the measurements.

$735

a month at risk from Grandma Iris alone, in the run pictured (an estimate, with its assumptions shown)

FIX IT AND RUN AGAIN

Every problem comes with a fix. Try it, and send them again.

Grandma Iris

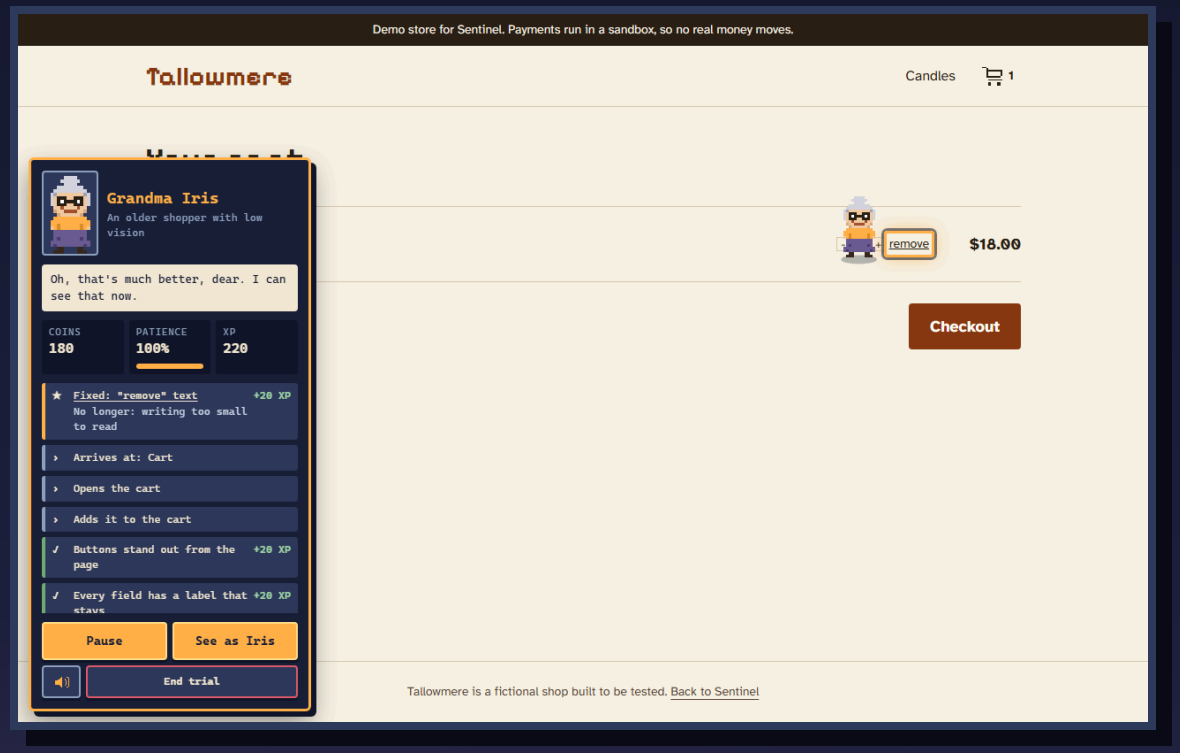

9 problems, sale lost → 0 problems, sale made

Pell

about 15 seconds to load → about 4

Dog

can't read the product → buys by itself

HOW IT WORKS

PayPal and AI do real work.

Braintree sandbox

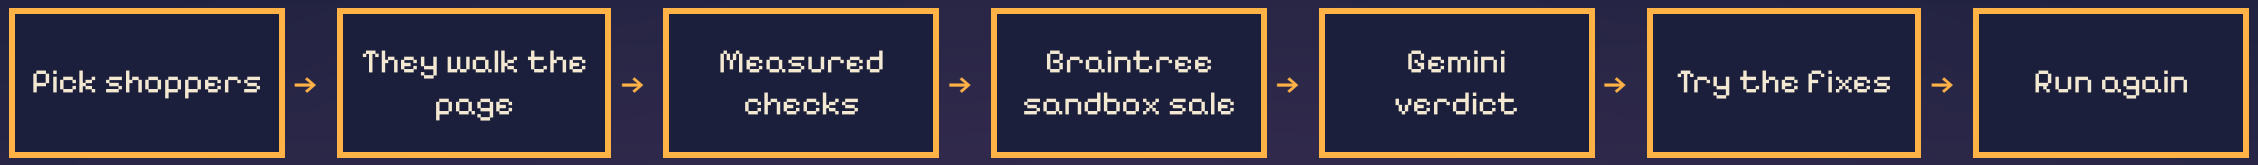

Real orders with line items, prices set on the server, declines, double-submit protection, and verified webhooks.

Gemini

Writes each verdict from the measurements. Cog's agent decides whether to buy. Suggested colours must pass the contrast maths.

Safe by design

Runs only on our demo store or sites whose owner added one line. Sandbox only. On owners' sites, shoppers only look.

WHO IT'S FOR

A small shop owner

Send all seven before the first customer arrives.

An agency

Paste one line into a client's site and hand over a clear list of fixes.

A developer

Try fixes in seconds and re-run before every release.

Every snag

Every problem your shoppers met, across 1 trials. Sort or filter any column.

Show technical detail

Search: Shopper, page, eleme

Trial	Shopper	Where	Problem	On	How bad	Fixed yet?
2026-11-12 16:27	Grandma Iris	Cart	Writing too small to read	"remove" text	Slows shoppers down	Not tried yet
2026-11-12 16:27	Grandma Iris	Your details	Too pale to read	"Full name" field	Can stop a sale	Not tried yet

2026-11-12 16:27	Grandma Iris	Your details	Too pale to read	"Email address" field	Can stop a sale	Not tried yet
2026-11-12 16:27	Grandma Iris	Your details	The box forgets its name once y...	"Email address" field	Slows shoppers down	Not tried yet

WHERE IT'S GOING

Today, checkouts. Next, whole sites and apps, for more kinds of people.

Whole journeys

Sign-up, search, booking and account pages, on websites and in apps.

More kinds of people

Colour blindness, dyslexia, memory and attention, older devices, bright sunlight.

Research data at scale

Simulated access needs give repeatable test data for accessibility research.

Safety as well as access

Security checks the owner switches on, which find common weaknesses and suggest fixes.

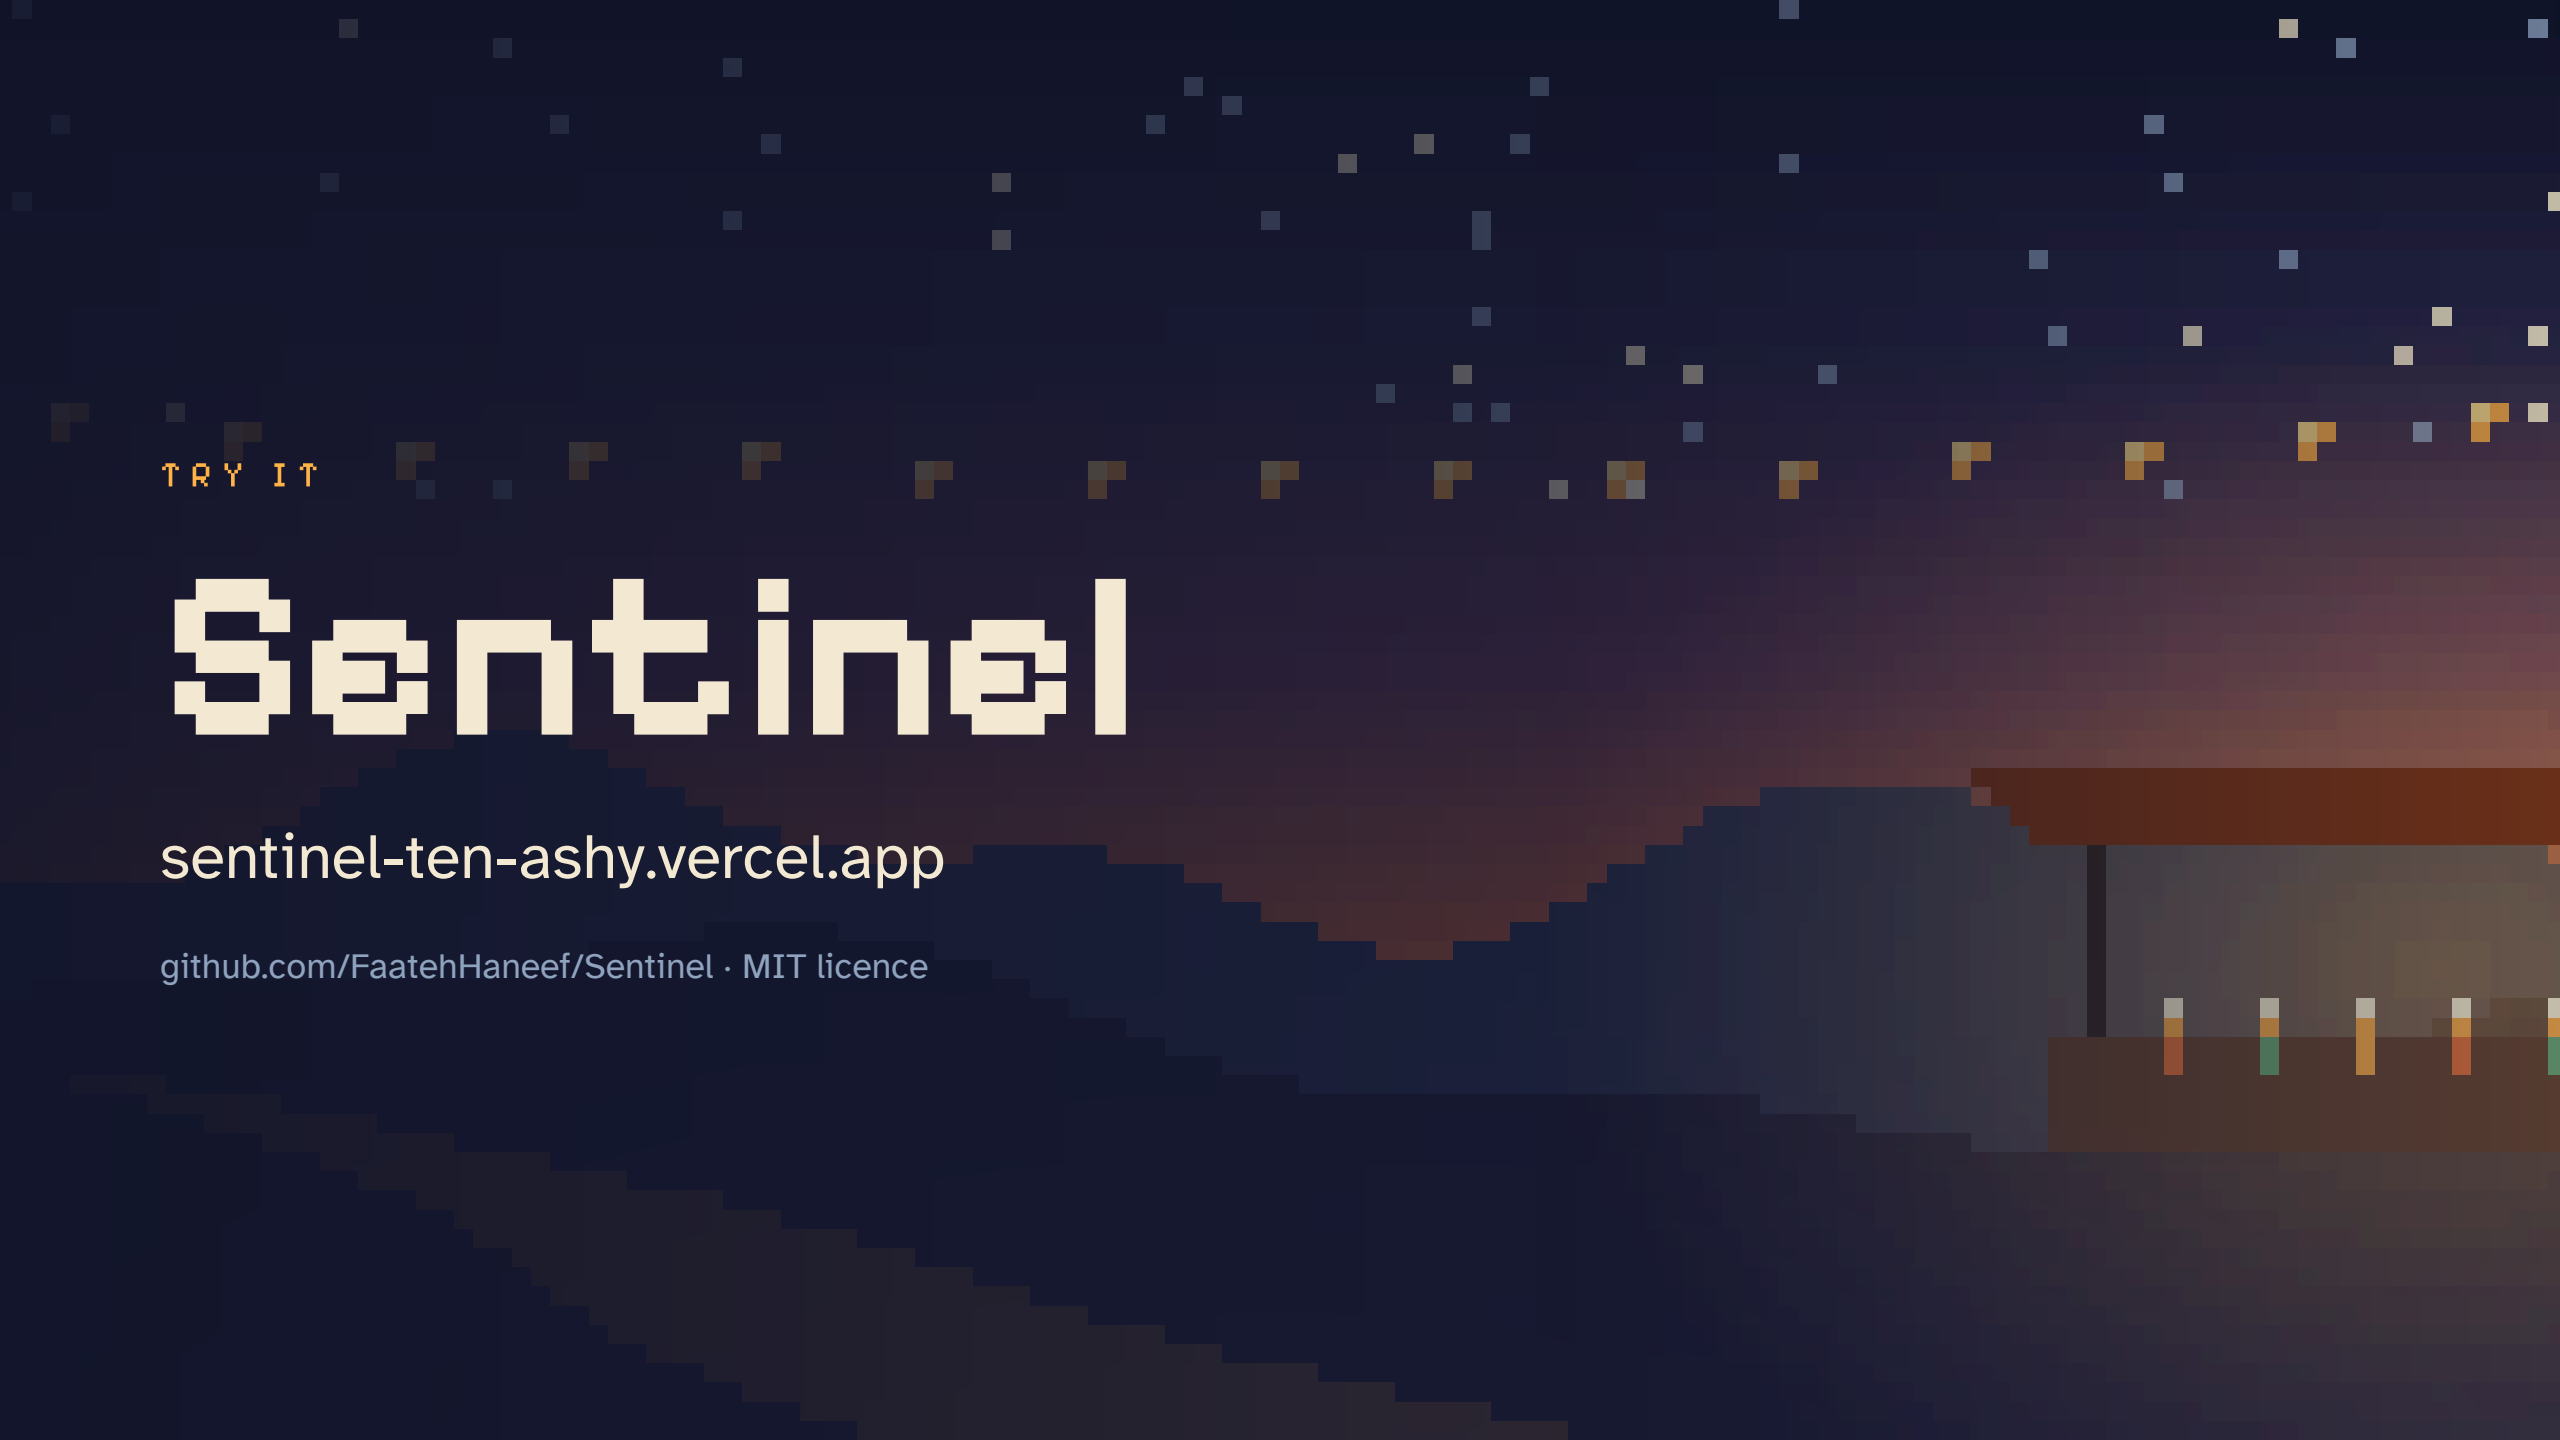

One safe connection

Link a site or app in a click. It still runs only where the owner puts it.

Simply priced

A clear standard of accessibility and safety, for any shop.

It doesn't replace testing with disabled people. It catches the measurable problems early, so those sessions go further.
